In skincare, acids refer to a category of chemical compounds that are used for various purposes to improve the appearance and health of the skin. These acids can be naturally occurring or synthetic and are applied topically to the skin in various formulations such as serums, creams, and cleansers. Acids in skincare are typically categorized into two main groups: alpha hydroxy acids (AHAs) and beta hydroxy acids (BHAs).

Growth of Exfoliating Acids: Alpha hydroxy acids (AHAs) and beta hydroxy acids (BHAs) like glycolic acid, lactic acid, salicylic acid, and mandelic acid continued to gain popularity for their exfoliating properties. These acids help remove dead skin cells, improve skin texture, and address issues like acne and hyperpigmentation.

Hyaluronic Acid: Hyaluronic acid is a hydrating acid that has been a staple in many skincare products. Its ability to hold water makes it a favorite for moisturizers, serums, and masks aimed at improving skin hydration and plumpness.

Niacinamide: While not an acid in the traditional sense, niacinamide (a form of vitamin B3) has been integrated into many skincare products due to its ability to address various skin concerns like pore size, redness, and uneven skin tone.

Polyhydroxy Acids (PHAs): PHAs gained attention as a gentler alternative to traditional AHAs and BHAs. They offer exfoliation benefits with reduced risk of irritation, making them suitable for sensitive skin.

Transparency and Education: Consumers are becoming more educated about skincare ingredients, including acids. Brands are responding by providing transparent information about the ingredients used in their products and how they benefit the skin.
