An acoustic floating floor is a type of flooring system designed to reduce noise transmission between floors in a building. It typically consists of a layer of soundproofing material, such as cork or rubber, that is installed between the subfloor and the finished flooring material. This helps to absorb impact noise and vibrations, preventing them from traveling through the floor and disturbing occupants in the rooms below. Acoustic floating floors are commonly used in multi-story buildings, such as apartments, hotels, and office buildings, to improve sound insulation and create a more comfortable living or working environment.

The global Acoustic Floating Floor market size is projected to grow from US\$ 1043.8 million in 2023 to US\$ 1528.7 million in 2030; it is expected to grow at a CAGR of 5.6% from 2024 to 2030.
