Acquired orphan blood disease is a type of rare blood disorder, which occurs due to the presence of insufficient amount of red blood cells in the blood. This disease is characterized by the body's inability to produce red blood cells. Moreover, improper functioning of bone marrow also leads to lack of red blood cells in blood, which in turn results in a decrease in platelet numbers. This decrease in platelet number causes anemia and thrombosis.

Soliris (eculizumab) is a perfect example of a successful orphan blood disease drug. PNH is a potentially life-threatening blood disease, characterised by severe anemia

caused by the destruction of red blood cells in the bloodstream. Bone marrow transplants can provide a cure, but the high risk procedure is suitable for only a few patients. Treatment methods include blood transfusions, iron therapy, and growth factors, but monoclonal antibody
