Abstracts

The global Acromegaly and Gigantism Drugs market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Gigantism refers to abnormally high linear growth due to excessive action of insulinlike growth factor I (IGF-I) while the epiphyseal growth plates are open during childhood. Acromegaly is the same disorder of IGF-I excess but occurs after the growth plate cartilage fuses in adulthood.

The global acromegaly and gigantism treatment market can be segmented into treatment, end users, and geographical expansion. On the basis of treatment, the market is divided into surgery, radiation therapy, and medication. The medication segment can be further divided into different drug types such as somatostatin analogs, GH receptor antagonists, dopamine agonists and others. The medication segment is expected to hold a significant market share during the forecast period due to factors such as effectiveness of drugs, noninvasive and lesser side effects than radiation therapies, and strong pipeline portfolio.
