The global Activate Carbond Filters market size is predicted to grow from US\$ 137 million in 2025 to US\$ 185 million in 2031; it is expected to grow at a CAGR of 5.2% from 2025 to 2031.

Activated carbon filters are generally employed in the process of removing organic compounds and/or extracting free chlorine from water, thereby making the water suitable for discharge or use in manufacturing processes. Eliminating organics in potable water, such as humic and fulvic acid, prevents chlorine in the water from chemically reacting with the acids and forming trihalomethanes, a class of known carcinogens.

Increasing water pollution has driven the use of activated carbon filters. Along with the growth in the food industry, the application of activated carbon in food processing is also driving this market. Activated carbon filters are also needed in the pharmaceutical industry to remove chemical impurities from drugs for purification. The cosmetics industry has also introduced activated carbon ingredients directly into toothpaste, soap, and skin care cleaning products.
