Activated carbon powder for supercapacitors is a crucial material in the field of energy storage. It is specifically engineered to possess a high specific surface area, well-developed pore structure, and excellent electrical conductivity, which are essential for the efficient operation of supercapacitors. The large surface area provides a vast interface for the adsorption and desorption of ions during the charging and discharging processes, enabling high-power density and rapid charge-discharge capabilities. Its pore structure, including micropores and mesopores, facilitates ion diffusion, ensuring fast ion transport and contributing to the overall performance of the supercapacitor. This type of activated carbon powder is typically derived from various carbonaceous precursors, such as coal, wood, or biomass, through activation processes like physical or chemical activation. Once produced, it is used as the electrode material in supercapacitors, which are widely applied in different sectors, from consumer electronics and electric vehicles to renewable energy systems, due to their ability to store and release electrical energy quickly, complementing and sometimes replacing traditional battery technologies in specific applications.
