Near Field Probe is a tool used to detect electromagnetic interference signals in the near - field region (the area within one wavelength from the radiation source) around electronic devices. It helps engineers to locate the sources of electromagnetic interference, and evaluate the intensity and frequency characteristics of the electromagnetic interference. It's a crucial device in the field of Electromagnetic Compatibility (EMC) testing. The active near field probe has a built-in preamplifier based on the traditional near-field probe. It has high sensitivity and can test some signals with relatively low amplitude.
