An active pneumatic vibration isolation system is a sophisticated vibration isolation technology that employs compressed air and a feedback control system to dynamically adjust the performance of isolators, counteracting the effects of external vibrations on sensitive equipment. The purpose of this system is to provide a stable operating environment, ensuring that the performance of precision equipment such as optical microscopes, laser devices, and measurement instruments is not compromised by external vibrations in vibration-sensitive applications. The active pneumatic vibration isolation system offers benefits including exceptional vibration isolation, significantly reducing the transmission of vibrations and enhancing the stability and reliability of the system; it also features high adjustability and adaptability, allowing optimization for different vibration sources and environmental conditions. Functionally, the system can respond in real-time to changes in vibration, quickly adjusting isolation performance to protect sensitive equipment from vibration damage, thereby improving the accuracy and repeatability of experiments and measurements.
