With recovery from influence of COVID-19 and the Russia-Ukraine War, Actively Mode-locked Laser are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Actively Mode-locked Laser. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Actively Mode-locked Laser market.

The actively mode-locked laser is a special type of laser that achieves very short pulse widths and high peak power outputs by controlling the laser generation and amplification process.

The working principle of actively mode-locked lasers is based on the mode-locking technology. By introducing external modulation or internal modulation, a specific frequency and phase relationship is introduced into the laser cavity, so that mutual interference modes are formed in the laser cavity. Actively mode-locked lasers have the following characteristics: ultrashort pulse, high peak power, wide frequency spectrum,

tunability and stability, and their ultrashort pulse and high peak power output characteristics make it an ideal choice for many high-precision and high-energy-density applications ideal light source.
