Acute hyperammonemia refers to a pathological condition in which ammonia levels in the blood rise rapidly. It is typically caused by urea cycle disorders, liver failure, inherited metabolic diseases, or drug toxicity. Ammonia is a byproduct of protein metabolism, and when it cannot be effectively excreted, it accumulates in the body, leading to neurotoxicity. Symptoms include vomiting, confusion, lethargy, and, in severe cases, coma and death. Acute hyperammonemia requires urgent treatment, usually through medications and dietary interventions to lower blood ammonia levels.
