The global ADC IC for BMS market size is predicted to grow from US\$ 360 million in 2025 to US\$ 549 million in 2032; it is expected to grow at a CAGR of 6.3% from 2026 to 2032.

The main function of the ADC chip is to quantize the analog signal in the BMS and generate a signal amplitude that can be represented by digital. There are two main indicators: conversion rate and conversion accuracy. The conversion rate determines how much bandwidth the ADC can convert analog signals. The bandwidth determines the maximum frequency of the analog signal that can be processed. The conversion accuracy measures the error between the converted digital signal and the original analog signal. The more bits the ADC has, the higher the accuracy and the slower the speed. The key difficulty of the ADC chip is that it is difficult to achieve both speed and accuracy. In addition, it is also necessary to consider parameters such as the chip range, ADC output interface, number of channels and packaging.
