The global Additive Manufacturing Aluminum Alloy market size is predicted to grow from US$ 1378 million in 2025 to US$ 2518 million in 2032; it is expected to grow at a CAGR of 9.2% from 2026 to 2032.

In 2024, global Additive Manufacturing Aluminum Alloy production reached approximately 35723 tons?with an average global market price of around US$ 35 per kg. Additive manufacturing aluminum alloys are advanced metallic materials specifically designed and optimized for 3D printing technologies such as selective laser melting (SLM), electron beam melting (EBM), and directed energy deposition (DED). Unlike conventional casting or wrought aluminum alloys, these alloys are formulated to exhibit high flowability, controlled particle size distribution, and stable microstructure formation during rapid solidification. By tailoring alloy compositions—often including elements such as silicon, magnesium, copper, zinc, scandium, or zirconium—these powders deliver enhanced mechanical properties, corrosion resistance, and thermal stability, making them suitable for high-performance applications. Produced primarily through gas atomization or plasma atomization, the spherical powders ensure high packing density, uniform layer deposition, and excellent process repeatability in additive manufacturing.

United States market for Additive Manufacturing Aluminum Alloy is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
