Adenoid sponges are medical sponges specifically designed for use in adenoidectomy surgeries. Adenoidectomy is a surgical procedure to remove the adenoids, which are small lymph tissue masses located in the back of the nose, above and behind the tonsils.

Adenoid sponges are sterile, absorbent, and disposable. They are made from soft, highly absorbent materials such as medical-grade cotton or synthetic fibers. These sponges are used to absorb blood, saliva, and other bodily fluids during the surgery, helping to keep the surgical site clean and reduce the risk of infection.

During an adenoidectomy, the adenoid sponges are placed in the surgical site to absorb blood and other fluids. This allows the surgeon to have a clear view of the surgical area and perform the procedure more effectively. The sponges can also be used to apply pressure to control bleeding.

After the surgery, the adenoid sponges are removed and discarded properly. They should never be reused, as this can increase the risk of infection and other complications.

In summary, adenoid sponges are an important tool in adenoidectomy surgeries, helping to keep the surgical site clean, reduce the risk of infection, and provide better visibility for the surgeon.
