Abstracts

The global Adhesiveless Copper Clad Laminates market size is predicted to grow from US$ 855 million in 2025 to US$ 1349 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

Adhesiveless copper clad laminates usually refers to non adhesive flexible copper-clad laminate, also known as two-layer flexible copper-clad laminate or 2L-FCCL. It is a flexible circuit substrate formed by directly composite copper foil with flexible insulation base films such as polyimide, LCP, MPI, etc., without traditional adhesive layers in the middle. Its common structure is copper foil with a base film, which can be divided into single-sided adhesive free copper-clad laminates and double-sided adhesive free copper-clad laminates. The manufacturing process includes coating method, sputtering electroplating method, pressing method, etc. Compared with three-layer flexible copper-clad laminates with adhesive, non adhesive copper-clad laminates have better heat resistance, dimensional stability, bending reliability, peel strength, fine line processing ability, and high-frequency and high-speed adaptability. They are widely used in high-end FPCs, soft hard bonding boards, camera modules, display modules, foldable screens, wearable devices, automotive electronics, 5G antennas, RF modules, advanced packaging, and high-density interconnect lines. In 2025, global Adhesiveless Copper Clad Laminates production reached approximately 85.33 M Sq m, with an average global market price of around US$ 10.24 per Sq m.

Adhesiveless copper clad laminates are an important direction for upgrading flexible circuit board materials, and their market position continues to improve due to the trend of electronic product thinning, circuit refinement, high-frequency and high-speed, and high reliability. Compared to traditional adhesive FCCL, non adhesive copper-clad laminates reduce the problems of thermal expansion, moisture absorption, aging, and

size changes caused by adhesive layers, making them more suitable for applications such as high-density circuits, dynamic bending, folding terminals, automotive electronics, and RF high-speed transmission. Future demand mainly comes from fields such as smartphone camera modules, OLED display connections, foldable screen hinge areas, in car displays and sensors, power battery soft connections, 5G communication modules, high-speed interconnection of AI servers, and advanced packaging. The focus of industry competition will be on PI film and copper foil composite technology, ultra-thin copper processing, low roughness copper foil adaptation, dimensional stability, peel strength, dynamic bending life, low dielectric loss, and batch consistency. With the increasing demand of downstream customers for highly reliable FPC materials, non adhesive copper-clad laminate enterprises need to have high-purity raw material control, precision coating, vacuum sputtering, electroplating uniformity, clean production, customer certification, and customized development capabilities. Overall, the cost of non adhesive copper-clad laminates is higher than that of ordinary adhesive copper-clad laminates, but their value is higher in high-end flexible circuits and high-frequency high-speed scenarios. In the future, the market will show a development trend of high-end, domestic substitution, diversified material systems, and deep customer binding.
