An adjustable torque converter is a transmission device that can change its output characteristics (such as the speed and torque of the output shaft) under certain input conditions through manual control or automatic adjustment. This device is mainly used in situations where it is necessary to adapt to load changes and maintain constant speed operation, or where a wide range of speed regulation is required when the load remains unchanged. The core feature of an adjustable torque converter is that its output characteristics (speed and torque) can be adjusted as needed. This is mainly achieved by changing certain constraints on the flow of fluid in the working chamber. An adjustable torque converter is usually a type of centrifugal turbine torque converter, including types such as adjustable impeller blades, adjustable oil filling, and adjustable guide vanes.

The global Adjustable Torque Converter market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
