Drug metabolism and pharmacokinetics (DMPK) studies are a type of preclinical study that is used to assess the absorption, distribution, metabolism, and excretion (ADME) of a drug candidate. This information is essential for understanding how a drug will behave in the body and for designing safe and effective clinical trials.

DMPK studies can be performed in vitro or in vivo. In vitro DMPK studies are typically used to screen a large number of compounds for their ADME properties and to identify promising candidates for further development. In vivo DMPK studies are typically performed later in drug development, after a compound has been shown to have promising ADME properties in vitro.
