## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Electrocardiography is the process of producing an electrocardiogram. It is a graph of voltage versus time of the electrical activity of the heart using electrodes placed on the skin. These electrodes detect the small electrical changes that are a consequence of cardiac muscle depolarization followed by repolarization during each cardiac cycle (heartbeat). Changes in the normal ECG pattern occur in numerous cardiac abnormalities, including cardiac rhythm disturbances (such as atrial fibrillation and ventricular tachycardia), inadequate coronary artery blood flow (such as myocardial ischemia and myocardial infarction), and electrolyte disturbances (such as hypokalemia and hyperkalemia).

An electrode is a conductive pad which is attached to the skin and enables recording of electrical currents. An ECG lead is a graphical description of the electrical activity of the heart and it is created by analysing several electrodes.

This report studies the Adult Electrocardiogram Electrodes market.
