According to our (LP Info Research) latest study, the global Advanced Interlayer market size was valued at US\$ million in 2022. With growing demand in downstream market and recovery from influence of COVID-19 and the Russia-Ukraine War, the Advanced Interlayer is forecast to a readjusted size of US\$ million by 2029 with a CAGR of % during review period.

The research report highlights the growth potential of the global Advanced Interlayer market. With recovery from influence of COVID-19 and the Russia-Ukraine War, Advanced Interlayer are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Advanced Interlayer. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Advanced Interlayer market.

Advanced intermediate film is a key component used in lithium-ion batteries, located between the positive and negative electrodes, used to isolate and prevent direct contact between the positive and negative electrodes inside the battery, while allowing for ion conduction. It has high heat resistance, chemical resistance, and safety performance, which helps to improve the performance and safety of batteries. Advanced intermediate films are mainly composed of the following components: thin film substrate: usually using polymer films as the substrate, such as polypropylene (PP) or polyethylene (PE). Pore structure: The advanced intermediate membrane has a uniformly distributed microporous structure to achieve ion conduction and prevent direct contact between electrodes. Surface coating: In order to improve the thermal stability and safety performance of advanced intermediate films, coating treatments such as heat stabilizers

or flame retardants are usually applied to their surfaces. The main functions and characteristics of advanced intermediate membranes include: electrolyte isolation: Advanced intermediate membranes can effectively isolate electrolytes, prevent direct contact between positive and negative electrodes, and prevent battery short circuits and overheating. Ion conduction: Advanced intermediate membranes have excellent ion conduction performance, allowing lithium ions to transport between positive and negative electrodes, thus achieving the charging and discharging process of the battery. Battery safety: Advanced intermediate membranes have high heat and chemical resistance, which can resist high temperatures and chemical reactions inside the battery and improve the safety performance of the battery. Thermal stability: the surface coating and material selection of advanced intermediate membrane can improve its high-temperature resistance and reduce the risk of Thermal runaway. The development and improvement of advanced intermediate membranes are crucial for improving the performance, cycle life, and safety of lithium-ion batteries, as they can effectively isolate positive and negative electrodes and promote ion conduction, while suppressing the occurrence of battery short circuits and overheating.
