Aerogel is a class of low-density solid gels in which the liquid has been replaced with air or gas. The structural framework of Aerogel is typically composed of silica, so silica aerogel is often referred to as simply 'Aerogel.' However, other structural materials have been used to create aerogels, including carbon, Iron oxide, etc. In insulation applications, Aerogel easily outperforms traditional fillers such as wool and fiberglass. In fact, Aerogel offers the same quality insulation with 1/3 the thickness of other insulating materials. However, Aerogel is expensive to manufacture and is rigid and brittle in its basic form, so it requires some supporting material. In addition, Aerogel withstands temperatures up to 1100 °F (593 °C), but is not suitable for extremely high-temperature applications that operate above that level.

The global Aerogel for EV Batteries market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.

Aerogels are well known to exhibit excellent thermal insulation (15-20mW/m.K). These are excellent features for an EV battery. Typically, battery cells are cooled via a thermal management strategy like water cold plates and coolant channels. However, around these it can be beneficial to thermally insulate the cells from each other. This aids in keeping cells warm in cold conditions and prevents heat transfer between cells in the event of an overheating cell. Aerogels also have a very low density (
