The global Aerogel Insulation for Building market size is predicted to grow from US\$ 525 million in 2025 to US\$ 965 million in 2032; it is expected to grow at a CAGR of 9.3% from 2026 to 2032.

Aerogel insulation is an advanced material with remarkable thermal insulating properties, making it highly desirable for a wide range of applications, including building insulation. Aerogel-based insulation materials offer superior thermal performance, lightweight construction, and effective energy efficiency. The global market for aerogel insulation in building applications has been driven by the increasing emphasis on energy conservation, sustainable construction practices, and the need to improve building envelope efficiency.

Governments worldwide are enforcing stricter building energy codes to reduce heating and cooling losses.

Aerogel offers 2–4 times better insulation performance than conventional materials such as fiberglass, mineral wool, or polystyrene.

Its thin profile enables high-performance insulation without compromising building space, which is particularly valuable in urban high-rise and renovation projects.

Compliance with LEED, BREEAM, and other green building certifications further boosts demand.

With growing urban density, construction projects require thinner wall sections to maximize usable space.

Traditional insulation materials often require thick layers, while aerogel achieves superior insulation with much thinner coatings or panels.

This makes aerogel highly attractive in renovations of historic buildings, where space and aesthetics are critical.

Modern building codes increasingly emphasize fire safety and flame resistance.

Aerogels are inherently non-combustible and fire-resistant, meeting stringent safety standards.

Their use in facade systems, curtain walls, and roofs provides both thermal insulation and fire protection, a dual benefit unmatched by many traditional materials.

Buildings are central to net-zero carbon commitments. Aerogel insulation reduces energy consumption for heating and cooling, cutting operational carbon emissions over the building's life.

Some aerogel products are silica-based and recyclable, aligning with the circular economy and sustainable construction trends.

Demand is rising from developers aiming to meet ESG (Environmental, Social, and Governance) targets.
