Aerogel, also known as xerogel, is a gel obtained by reacting a chemical solution to form a sol and then gelling. The solvent in the gel is removed to obtain a spatial network structure filled with gas, and the appearance is Solid-like porous material with very low density (close to air density). Aerogels have ultra-light, low-density, nano-pores, and are characterized by ultra-fine honeycomb pore size and porous structure, which are composed of interconnected polymer chains. It is usually less than 100 nm, and the aerogel particle size is usually less than 20 nm. It can be made of inorganic materials (such as silica, alumina, etc.), organic materials (such as polyethylene glycol, carbon, etc.), or mixed materials (such as gel glass, etc.). At present, silicon-based aerogels are mainly used in the market.

The global Aerogels market size is projected to grow from US\$ 887 million in 2024 to US\$ 2045 million in 2030; it is expected to grow at a CAGR of 14.9% from 2024 to 2030.
