## Abstracts

The global Aerosol and Dust Monitors market size is predicted to grow from US\$ 1699 million in 2025 to US\$ 3162 million in 2032; it is expected to grow at a CAGR of 9.5% from 2026 to 2032.

Aerosol monitors, commonly referred to as dust monitors, particulate monitors, light scattering laser photometers, and nephelometers, are used to measure dust, smoke, mist, fume, condensates, and fog.

PM monitoring is primarily used to provide data on air quality to local, state, and federal regulatory programmes so they can assess whether a region has met the National Ambient Air Quality Standards (standards). For comparisons to the standards, a Federal Reference Method (FRM) sampler is utilized, which ensures nationwide consistency in air pollution monitoring. The gravimetric approach is the latest FRM for detecting PM 2.5 in the environment. A certain flow rate of ambient air is drawn via particular filters during FRM-based monitoring. The filters are measured after and before sampling at a suitable position, and the time-averaged density for the sampling period is calculated by dividing the net mass of particles collected on the filter by the full volume of air tested.
