The aerosol online measuring instrument is a device used for real-time measurement of aerosol concentration and size distribution. It is typically used for environmental monitoring, air quality control, and industrial hygiene applications. The working principle of the instrument is to inhale air through the sampling port and make it pass through the detection room, where the aerosol particles are illuminated with light source. Then, the scattered light is measured by the detector, which generates a signal proportional to the concentration and size distribution of aerosol particles. Online aerosol measurement instruments can provide real-time data on aerosol concentration and size distribution, which helps to monitor air quality in real-time. They are also used in the development of aerosol technology, such as inhalation drug delivery systems and spraying.
