Aerosol is suspension of liquid or solid particles in a carrier gas, which makes use of it for treatment of respiratory system related diseases. Different forms of drugs can be utilized for aerosol therapy such as solid particles, liquid particles, solutions, and suspensions. Until recently, aerosol therapy concentrated primarily on treatment of asthma and COPD for which, pressurized metered-dose inhaler device was used. However, the role of aerosol therapy is expanding beyond the initial focus. This expansion eliminated CFC-based traditional metered-dose inhalers devices. This will ultimately boost the market growth of aerosol therapy in the field of gene therapy, inhalation therapy and vaccination. Aerosol therapy is a natural and easiest way to treat asthma, COPD, cystic fibrosis, and broncho pulmonary dysplasia (BPD). Aerosol therapy is also used to deliver insulin, vaccines of influenza and measles, and pain medications. Aerosol treatment therapy gives an excellent and cost-efficient drug delivery. This therapy is effective for patients who cannot use metered-dose inhalers; primary inhalation devices are produced that guarantee breath-actuated aerosol delivery with minimal side effects.
