The global Aesculus Chinensis Extract market size is predicted to grow from US$ 45.31 million in 2025 to US$ 55.58 million in 2032; it is expected to grow at a CAGR of 3.0% from 2026 to 2032.

The industrial production of Aesculus chinensis extract, derived from the seeds of the Chinese horse chestnut tree, involves a carefully controlled sequence of raw material preparation, extraction, and purification to yield a bioactive product rich in saponins, particularly aescin, along with flavonoids and other secondary metabolites. The primary raw material is the mature, dried seeds of Aesculus chinensis, which are harvested when they reach optimal ripeness in late summer or autumn. These seeds are chosen because they contain the highest concentration of aescin, a triterpenoid saponin known for its pharmacological effects, such as anti-inflammatory, vasoprotective, and anti-edematous properties. Before processing, the seeds are cleaned to remove husks, foreign matter, and dust, then dried under low heat to prevent enzymatic degradation of bioactive compounds. Other raw materials used in production include solvents such as ethanol, methanol, or water, sometimes in combination, as well as purification aids like macroporous adsorption resins or membrane filtration systems, which assist in selectively isolating and concentrating the desired saponins while minimizing impurities like tannins, fats, and polysaccharides.

The production process begins with comminution, where the dried seeds are crushed or ground into coarse powder to improve extraction efficiency. The powdered raw material is then subjected to solvent extraction, most often through reflux extraction or percolation with aqueous ethanol, which effectively solubilizes the saponins. To ensure maximum yield, extraction is typically carried out under controlled temperature and pH conditions, as saponins can be sensitive to excessive heat or strong acidic/alkaline

environments. The crude extract is subsequently filtered to remove solid residues, and the filtrate is concentrated under reduced pressure to remove excess solvent. To improve purity and enrich the aescin content, additional purification steps are applied, such as adsorption onto macroporous resin columns, liquid–liquid partitioning, or chromatographic separation. These methods help achieve higher concentrations of pharmacologically active saponins while eliminating unwanted impurities that could affect stability or safety. Finally, the refined extract is dried into a stable form using techniques such as spray drying, vacuum drying, or freeze-drying, producing a powder with standardized aescin content suitable for industrial and pharmaceutical applications. Throughout the process, rigorous quality control is implemented, including assays for saponin concentration, verification of solvent residues, and testing for microbial or heavy metal contamination, ensuring that the final Aesculus chinensis extract is both effective and safe for use in medicinal, nutraceutical, or cosmetic formulations.

The Aesculus Chinensis Extract industry chain starts with upstream materials such as harvested Aesculus Chinensis seeds and extraction solvents, and extends downstream into applications in pharmaceuticals, nutraceuticals, topical formulations, and health supplements.

In 2024, global Aesculus Chinensis Extract production reached approximately 8717 MT, with an average global market price of around US$ 5145 per MT. The global single-line production capacity ranges from 250 to 300 MT per year. The industry's gross profit margin is approximately 20%-25%.
