An AFM (Atomic Force Microscope) microscope system is a scientific instrument used for high-resolution imaging and probing of various materials at the nanoscale level. It is a type of scanning probe microscopy that uses a small probe, typically with a sharp tip at the end, to scan the surface of a sample and measure its topography and physical properties. The AFM microscope system works by bringing the probe in close proximity to the sample surface, where forces between the probe and the surface cause a deflection of the probe. This deflection is measured and used to generate a topographic image of the sample surface with nanometer-scale resolution. The probe can also be used to measure other properties such as surface roughness, elasticity, conductivity, and magnetic properties. The system typically consists of several key components, including the probe or cantilever with a sharp tip, a laser beam that interacts with the deflection of the probe, a detector to measure the deflection, and a computer-based control system for data acquisition and analysis. The AFM microscope system may also include additional features such as environmental control to study samples in different conditions, various imaging modes, and advanced data analysis capabilities.

The global AFM Microscope System market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
