Age-related macular degeneration (AMD) is a progressive eye disease that affects the macula, a part of the retina responsible for central vision. The cells in the macula become damaged and begin to die, causing vision loss as a person ages. The disease is typically categorized into two types: dry age-related macular degeneration (AMD) and wet age-related macular degeneration (AMD). Dry AMD is more common and involves the formation of small, yellow deposits in the macula, while wet AMD is less common and involves the growth of abnormal blood vessels beneath the macula. In dry AMD, treatment options include vitamin supplements and lifestyle changes to reduce risk factors. In wet AMD, treatment involves medications that are injected into the eye to stop the growth of abnormal blood vessels. This treatment is called abnormal endothelial growth factor (anti-VEGF) therapy, and it works by blocking the protein that stimulates the growth of abnormal blood vessels.

The global Age-Related Macular Degeneration (AMD) Treatment Drugs market size is projected to grow from US\$ 10480 million in 2024 to US\$ 14800 million in 2030; it is expected to grow at a CAGR of 5.9% from 2024 to 2030.
