An AGM battery is designed for two jobs: delivering powerful bursts of starting amps and running electronics for a long time. They tend to last longer than a regular flooded battery. AGM batteries also have valves regulating the amount of hydrogen and oxygen gas allowed to escape during charging. They fall under a broader category of valve-regulated, lead-acid (VRLA) batteries, typically used for storing a lot of power for a long time or for long-running power uses. Developed in the late 1970s, AGM batteries mostly

served as backup power for telephone boxes and early computer rooms. There are two types of AGM batteries – lead-calcium and Thin Plate Pure Lead (TPPL).

Lead-calcium: Lead-calcium AGM batteries have many of the operating limitations of the flooded, wet cell battery, but without the hazardous issues. They are single purpose in function and design. The “SLI” design – starting, lighting and ignition – is pulse starting, but cannot be deep cycled. Doing so would shorten service life dramatically. Lead-calcium “deep cycle” batteries are also single purpose by design in that they support deep discharging, and have a specific deep discharge cycle rating. Their thick plates don’t allow for pulse starting power like the SLI design.

TPPL: TPPL AGM batteries are dual purpose, have the highest CCA ratings and deep cycle at 400 cycles to 80% depth of discharge. They can be fast charged, and discharged, in the range of -40°F (-40°F) to 176°F (80°C) provide 10-12 years of float service and, best of all, do not fail catastrophically. TPPL AGM batteries are certified environmentally friendly as non-hazardous and non-spillable by US-DOT and International Air Transport Association (IATA). Their use expanded over the decades to include motorcycles, military, aircraft, submarines and power banks for offices.

AGM Super Cycle batteries are the result of recent battery electro chemistry developments. The paste of the positive plates is less sensitive to softening, even in case of repeated 100% discharge of the battery, and new additives to the electrolyte reduce sulfation in case of deep discharge.
