## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Centrifugal water pumps are any pump that induces flow or raises pressure of a liquid which results in a pumping action. The centrifugal is the preferred hydraulic pump and is used in over 95% domestic and industrial applications. They are low in cost and maintenance, simple to operate and as a result are used universally.

Inside the case of the pump lies a impeller, which consists of a set of curved vanes. These vanes rotate when submersed in water which with it rotates the liquid. By doing this it builds up a centrifugal force to the water particles and forces the water out. An easy way to imagine this is the effect of water flicking off a car tyre on a wet road. Rather than a scooping action from the vanes on the impeller the force comes centrifugally.
