The global Agricultural Grade Manganese Sulfate market size is predicted to grow from US\$ 2573 million in 2025 to US\$ 3383 million in 2031; it is expected to grow at a CAGR of 4.7% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Agricultural grade manganese sulfate is an important micronutrient fertilizer, mainly used to supplement manganese that may be lacking in soil. Manganese is a trace element needed for plant growth, which is essential for chlorophyll synthesis, photosynthesis and the function of various enzymes.

Market Concentration and Key Players:

Internationally, the market concentration of agricultural grade manganese sulfate is relatively high, mainly concentrated in developed countries such as Europe, America and Japan. For example, Vibrantz, Atul and other large manufacturers; from the domestic point of view, the production of agricultural grade manganese sulfate enterprises have southern manganese industry, Qinzhou Nanhai chemical and other enterprises manufacturing process and market trends:

The manufacturing technology of agricultural grade manganese sulfate is based on hydrometallurgy technology. First, impurities are removed by crushing manganese ore and acid washing. Pyrolusite needs to be converted into manganese monoxide through reduction roasting, and then reacts with sulfuric acid to form manganese sulfate

solution. Then the solution is purified, ammonium sulfide is added to precipitate heavy metals, concentrated, cooled to precipitate calcium, silicon and magnesium impurities, and filtered for the second time. The final purified solution is crystallized at high temperature and dried to obtain light pink particles or powder finished products. In recent years, electrolysis has gradually become the mainstream due to the reduction of energy consumption by 20%, while autoclave crystallization has gradually been popularized due to high recovery rate and good product purity.

Market trends show three major directions: the agricultural sector due to soil improvement and feed additive demand steady growth, China production capacity accounts for more than 40% of the world. Technology upgrade: the company develops bio-based processes and autoclave crystallization methods, and the proportion of high-purity products in 2030 is more than half. Environmental protection policies force industrial chain integration and promote recycling technology. Green transformation: Policies support tax incentives and financial subsidies to promote enterprises to develop low-energy, pollution-free processes, but high-end process costs are 2 - 3 times that of traditional products, and it is necessary to deal with lithium resource competition and overcapacity risks.
