AI in Industrial Maintenance refers to intelligent solutions that apply artificial intelligence technologies such as machine learning and deep learning to predictive maintenance, diagnosis, and optimization decisions for industrial equipment and production systems. Its core lies in continuously collecting equipment operating data (vibration, temperature, current, etc.) and using AI algorithms to train equipment health models, enabling early fault warnings, remaining life prediction, and maintenance strategy recommendations. Unlike traditional planned maintenance or reactive repair, AI maintenance can dynamically identify abnormal equipment patterns, accurately pinpoint the root cause of failures, significantly reduce unplanned downtime, and minimize spare parts inventory waste. This technology is widely used in wind power, petrochemicals, steel, and high-end manufacturing sectors. By learning from massive amounts of historical data, it transforms passive response into proactive intervention, significantly improving equipment reliability and operational efficiency, making it a key technology for maximizing asset value in the Industry 4.0 era.
