AI-powered retina image analysis refers to the use of artificial intelligence and machine learning algorithms to evaluate retinal images, often captured by fundus cameras or optical coherence tomography (OCT) devices. These systems are designed to automatically detect and diagnose various eye conditions such as diabetic retinopathy, age-related macular degeneration, and glaucoma by analyzing patterns, textures, and anomalies in the retina. The AI models are typically trained on vast datasets of retinal images, enabling them to achieve high accuracy and consistency in detecting early-stage diseases. This technology aids ophthalmologists by improving diagnostic efficiency, reducing human error, and allowing for faster, more accessible eye health assessments.
