The global AI Prosthesis market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

AI prostheses are bionic prostheses that use artificial intelligence technology to achieve autonomous control and restoration of motion through sensing human neural signals and machine learning algorithms. It can interact with the human nervous system through wireless signals and implanted electrodes to simulate muscle contraction and relaxation, as well as movements of fingers, palms, wrists and other parts. The advent of this technology brings new hope to the amputee population and helps them regain limb function and daily self-care ability.

The implementation of AI prostheses requires the use of various technologies, including machine learning, signal processing, neural networks, and more. By implanting electrodes or attaching electrodes, the prostheses can receive neural signals, decode and analyze these signals using machine learning algorithms, identify the muscle's intent and movement direction, and finally control the prostheses to complete the corresponding movements. This technology requires a high degree of accuracy and sensitivity to achieve freedom of movement and natural movement effects.

AI prostheses have made some progress in the medical field, such as in rehabilitation treatment, disability rehabilitation, limb compensation, and other areas with broad application prospects. In addition, AI prostheses also provide new ideas and technical support for research in other fields, such as robotics, intelligent hardware, and more.

China and the United States are two leaders in AI industry. On the AI 100 list (2022) released by CB Insights, the number of companies in the United States ranks first, with more than 70 companies, followed by the United Kingdom, with 8 companies on the list. China and Canada both holds 5 companies on the list. According to data from the China

Academy of Information and Communications Technology, the scale of China's core artificial intelligence industry reached ?508 billion in 2022, a year-on-year increase of 18%. From 2013 to November 2022, the cumulative number of patent applications for artificial intelligence inventions in the world reached 729,000, and the cumulative number of applications in China reached 389,000, accounting for 53.4%. However, the Global Artificial Intelligence Innovation Index Report 2021 released by the China Institute of Scientific and Technological Information shows that the overall strength of the United States is still far ahead. The number of artificial intelligence companies in the United States is about 4,670, while China has only 880. China's data center is less than 1/133 of that of the United States.
