The gross profit margin of major companies in the industry is between 18.75%–35.62%.

In 2025, the global production capacity of AI Server Busbar was approximately 91.37 million units.

AI Server Busbar is a conductive power distribution component used in AI servers, GPU trays and high-density computing systems to deliver high-current power with lower resistance, compact layout and improved thermal performance. It is usually made from copper or aluminum with plating, insulation layers, laminated structures, fastening interfaces and customized shapes. The product supports power distribution from power shelves or power boards to accelerators, processors and server subsystems. The market includes server-level and tray-level busbars for AI computing platforms, but excludes general electrical busbars, complete power supplies and data center busway systems.

The industry chain includes copper, aluminum, nickel or tin plating materials, insulation films, fasteners, stamping parts, laminated materials, precision molds and electrical testing equipment. Midstream production covers cutting, stamping, bending, plating, lamination, insulation processing, assembly, resistance testing and thermal validation. Downstream demand comes from AI servers, GPU systems, accelerator trays, high-performance computing platforms, cloud data centers and server power architecture

suppliers. Growth is driven by higher GPU power density, rack-scale power delivery, AI cluster expansion and demand for compact low-loss current distribution.

United States market for AI Server Busbar is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
