The global AI Server High-Speed Copper Cable Interconnect Systems market size is predicted to grow from US\$ 2802 million in 2025 to US\$ 7952 million in 2032; it is expected to grow at a CAGR of 13.1% from 2026 to 2032.

AI server high speed copper cable interconnect systems are copper based hardware interconnect products used for short reach, high bandwidth data transmission inside AI servers, GPU servers, AI racks and high performance computing clusters. The product scope mainly covers passive direct attach copper cables, active copper cables, active electrical cables, high speed twinax cable assemblies, near chip copper cable links, backplane copper cable assemblies and high speed I/O cable assemblies. These systems rely on low loss copper conductors, precision shielding, high speed connectors, signal integrity design, thermal management, automated cable assembly, accurate crimping or welding processes and high speed electrical testing. Key specifications include data rate, lane count, cable length, connector form factor, bit error rate, insertion loss, return loss, power consumption, bend radius and mechanical reliability. Their core function is to provide low latency, high bandwidth and relatively low power electrical interconnection among GPUs, switches, network interface cards, compute trays and rack level backplanes in AI computing infrastructure. The product is mainly used in AI training servers, inference clusters, hyperscale data centers, high performance computing systems and rack scale accelerated computing platforms. In 2025, the global average selling price of AI server high speed copper cable interconnect systems is estimated at about USD 450 per unit, global shipment volume is estimated at about 6.36 million units, and the industry average gross margin is estimated at about 26% to 34%.

AI server high speed copper cable interconnect systems are becoming a strategic hardware layer in AI infrastructure rather than a conventional cabling category. The

upstream chain includes high speed copper conductors, low loss dielectric materials, shielding materials, high speed connectors, retimer or redriver related components, precision assembly equipment and electrical testing systems. The midstream segment covers the design and manufacturing of passive direct attach copper cables, active copper cables, active electrical cables and high speed internal cable assemblies. The downstream demand is concentrated in AI servers, GPU clusters, hyperscale data centers, rack scale computing platforms and high performance computing systems. As AI architecture moves from server level acceleration to rack level and cluster level acceleration, the number of high speed links inside each system increases sharply. Copper interconnects are therefore no longer a low value accessory. They directly affect bandwidth, latency, power consumption, heat dissipation, serviceability and overall system reliability. This gives the industry a stronger growth logic than traditional enterprise cabling, while also raising technical barriers in signal integrity, thermal design and high volume electrical testing.

The competitive landscape is shaped by three groups of suppliers. Global interconnect leaders still have advantages in connector platforms, high speed I/O standards, customer qualification, testing capability and system engineering. Chinese and Taiwanese manufacturers are gaining share through large scale manufacturing, faster delivery cycles, cost efficiency and closer alignment with AI server supply chains. Specialized high speed cable companies are also entering the market through DAC, ACC and AEC product lines. New product activity is mainly concentrated in 800G, 1.6T, active copper cable and active electrical cable solutions, as AI racks require higher density and better loss compensation than traditional passive copper links. Capacity expansion and qualification programs are becoming important, because customers care not only about product specifications but also about stable delivery, regional supply security and batch consistency. Supply chains are gradually becoming more geographically diversified, with production and assembly capacity spread across China, Taiwan, Southeast Asia, North America and selected European bases.

The policy and investment environment remains supportive, as AI computing infrastructure, data center upgrades, advanced networking and digital economy policies continue to stimulate demand for high bandwidth interconnect hardware. However, the industry should not be treated as a straight line hyper growth market. Copper has strong advantages in short reach, low latency, power efficiency and cost, especially within racks and across nearby systems. At longer distances, optical interconnects will continue to compete with and partially replace copper based solutions. Future growth will therefore come from a combination of AI rack penetration, higher adoption of ACC and AEC products, migration toward 224G PAM4 electrical specifications, and better

automated manufacturing and testing capability. The most competitive suppliers will be those that can combine high speed connector design, cable process control, signal integrity expertise, customer qualification speed and reliable mass production. The industry outlook remains positive, but valuation and capacity assumptions should remain tied to real AI server deployment cycles and product mix upgrades.
