The majority of the energy used by an air compressor is converted to heat, and as air temperature increases, the capacity for the air to store water vapor also increases. Manufacturers commonly use aftercoolers to combat both issues. Aftercoolers are heat exchanger units that remove heat and water vapor from compressed air so pneumatic equipment can use it safely. Air-cooled aftercoolers use blown air and a series of coils to reduce compressed air temperature and remove moisture. The compressed air moves through the coils of the aftercooler, and a motor-driven fan forces air over the coils to displace the heat. As the air cools, water vapor condenses and collects at the drain valve.

The global Air-Cooled Aftercooler market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
