The global Air-cooled Battery Pack market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Air-cooled battery packs are heat dissipation systems that use air as a cooling medium to reduce battery temperature through natural wind or forced ventilation (such as fans). Air cooling systems are divided into two forms: natural air cooling and forced air cooling. Natural air cooling relies on the airflow generated when the vehicle is driving, while forced air cooling actively promotes air flow through devices such as fans. The advantages of air-cooled battery packs include simple structure, low cost, easy maintenance, and no risk of liquid leakage. However, the disadvantages of air-cooled systems are relatively low cooling efficiency and high sealing requirements for battery packs to prevent the intrusion of dust and moisture. When designing air-cooled battery packs, factors such as the flow channel design inside the battery, the inlet and outlet structure, and the fluid parameters of the cooling air need to be considered to optimize the heat dissipation effect and the uniformity of the battery temperature. In addition, the air cooling system can be improved through optimization algorithms and strategies to improve its performance. With the development of electric vehicle technology, air-cooled battery packs may gradually fail to meet the heat dissipation needs of high-power and high-energy density batteries. Therefore, more efficient cooling technologies such as liquid cooling and direct cooling are becoming mainstream. Liquid cooling systems cool batteries through convective heat transfer of liquid media, while direct cooling systems use refrigerants to directly absorb and remove heat from the battery system. These technologies can provide more efficient cooling effects, especially for high-performance and high-energy-density battery systems.
