The global Air-Cooled Hydrogen Fuel Cell Systems market size is predicted to grow from US\$ 470 million in 2025 to US\$ 2033 million in 2032; it is expected to grow at a CAGR of 23.4% from 2026 to 2032.

Fuel cells can be divided into water-cooled fuel cell systems and air-cooled fuel cell systems. Water-cooled fuel cell systems have higher rated power and are more complex in structure and control, but they were developed earlier. The fuel cell industry has gradually expanded from high-power water-cooled fuel cell stack systems for passenger cars and commercial vehicles to low-power air-cooled fuel cell stack systems for applications such as drones, forklifts, and bicycles. Air-Cooled Hydrogen Fuel Cell Systems are devices that use the electrochemical reaction of hydrogen and oxygen to generate electricity, employing an air-cooling system to maintain a stable temperature for the fuel cell stack. Unlike traditional liquid-cooled hydrogen fuel cells, air-cooled hydrogen fuel cells dissipate heat through natural airflow or fan-provided airflow, avoiding the complexity of liquid cooling systems. These hydrogen fuel cells are generally used in low- to medium-power applications, such as portable devices, backup power supplies, and lightweight electric vehicles. Their advantages include simple structure, lower cost, and lightweight system, making them suitable for applications with low power density and cooling requirements. Upstream raw materials mainly include fuel cell stacks, membrane electrode assemblies (MEAs), bipolar plates, catalysts, and auxiliary equipment. The fuel cell stack accounts for 63% of the total cost. With the gradual advancement of domestic production, raw material prices are trending downwards. Downstream companies include manufacturers of hydrogen-powered two-wheeled vehicles, three-wheeled vehicles, automated guided vehicles (AGVs), golf carts, and drones. In 2025, the global production of Air-Cooled Hydrogen Fuel Cell Systems is estimated at approximately 648,700 units, with an average selling price of

US\$740.204 per unit and a gross profit margin of 30.78%. Companies in this sector are expected to produce 100,000 air-cooled fuel cell systems annually.

Case Study: GCL New Energy Holdings Limited's 12kW air-cooled hydrogen fuel cell and its mass-produced 20kW single-gate air-cooled hydrogen fuel cell H400 are mainly used in medium-to-high power hydrogen-powered drones, hydrogen-powered yachts, and other high-power products. Shengshi Yingchuang officially released its pioneering 20kW high-power air-cooled fuel cell stack based on a cathode-enclosed metal bipolar plate design.

Fuel cells can be divided into water-cooled fuel cell systems and air-cooled fuel cell systems. Water-cooled fuel cell systems have higher rated power and are more complex in structure and control, but they started earlier. The fuel cell industry has gradually expanded from high-power water-cooled stack systems used in passenger cars and commercial vehicles to small-power air-cooled stack systems used in drones, forklifts, bicycles, etc. With the increasing global demand for green energy and zero-emission vehicles, the market for small air-cooled hydrogen fuel cells has ushered in new opportunities. Hydrogen energy, as a key form of sustainable energy, is gaining increasing favor from countries and companies. Hydrogen fuel cells have the characteristics of high energy density and zero emissions, making them particularly suitable for high-power demand fields such as electric vehicles, drones, and portable power devices. In addition, policy support, technological innovation, and the improvement of hydrogen supply infrastructure have provided strong driving forces for the development of this industry. Despite the broad market prospects, some challenges remain. First, the production cost of hydrogen fuel cells is relatively high, especially in miniaturized and low-cost applications, which may affect their large-scale commercialization process. Second, the construction of hydrogen infrastructure remains a key factor restricting market development, and the construction of hydrogen refueling stations and other infrastructure in many regions is still inadequate. Finally, the complexity of technological research and development leads to high R&D costs and technological bottlenecks, requiring companies to continuously innovate and optimize their technologies. With the diversification of market demand, especially in the fields of electric vehicles and drones, the demand for small air-cooled hydrogen fuel cells is constantly growing. In the coming years, this market is expected to gradually expand, particularly driven by green energy promotion policies in Asia, North America, and Europe, leading to a continued increase in market penetration. Companies need to focus on product performance, cost control, and hydrogen supply chain optimization to better meet market demands.
