The global Air-cooled Semi-hermetic Condensing Unit market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Air-cooled Semi-hermetic Condensing Unit is a device used to cool and condense the working medium (usually steam or other gases).

Air-cooled: This means that the condensing unit uses air as the cooling medium. Typically, such systems use fans to move ambient air through a radiator or condenser to dissipate heat from the working mass.

Semi-hermetic: This means that the structure of the condensing unit is partially closed, but not completely sealed. Such a design may be intended to provide some convenience during maintenance and operation while still being able to maintain some environmental control.

Condensing Unit: This is a system that includes components such as a compressor, condenser, and expansion valve. The compressor compresses low-pressure, low-temperature gas into high-pressure, high-temperature gas, and then dissipates heat through the condenser to cool the gas and condense it into a liquid. This process is commonly used in refrigeration and air conditioning systems.

To sum up, the air-cooled semi-closed condensing unit is a device that uses air cooling to achieve condensation of the working substance, and its structural part is semi-closed. This design may have some advantages in certain application scenarios, such as ease of maintenance or adaptability to specific environmental conditions.
