The global Air Core Series Reactor market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Air-core series reactor is an electrical component commonly used in power systems, especially to limit current and regulate voltage. It is an inductor that is connected in series in a circuit and has coil windings but an air core. Air-core series reactors work by limiting current and regulating voltage through their inductive properties. When current passes through an air-core series reactor, due to its inductive nature, an impedance is created, which reduces the magnitude of the current. This helps control the flow of current and acts as a protection and voltage regulator in the circuit. Air-core series reactors usually consist of a circular or oval coil with a hollow space in the middle. This design can reduce the size and weight of the component and improve its efficiency and heat dissipation performance.

United States market for Air Core Series Reactor is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
