An Air Corona Discharge Ozone System is a type of ozone generator that uses corona discharge to produce ozone gas from ambient air. In this process, ambient air is passed through the ozone generator where it undergoes corona discharge, creating a high-voltage electrical field that converts oxygen (O<sub>2</sub>) molecules in the air into ozone (O<sub>3</sub>) molecules.

The global Air Corona Discharge Ozone Systems market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.

The Air Corona Discharge Ozone System typically consists of two electrodes, usually made of metal or ceramic, separated by a dielectric material. When a high voltage is applied to the electrodes, a corona discharge is initiated, causing a portion of the oxygen molecules in the air to split into individual oxygen atoms. These oxygen atoms then react with further oxygen molecules to form ozone. This type of ozone generator is commonly used in applications where small to moderate concentrations of ozone are required, such as sterilization, odor control, and air purification. However, the purity and concentration of ozone generated from air corona discharge ozone generators are generally lower compared to other types of ozone generators that utilize pure oxygen. Proper maintenance and cleaning of the air corona discharge ozone generator are essential to ensure its optimal performance. It is important to consider safety precautions when operating these generators, as they can produce high voltages and ozone gas, which can be harmful in high concentrations. Following manufacturer guidelines and regularly monitoring ozone levels are crucial to ensure safe and effective operation.
