The global Air Deodorization Biofilter market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

An Air Deodorization Biofilter is an environmentally friendly and sustainable air purification system designed to remove foul odors and volatile organic compounds (VOCs) from the air. It consists of a biofiltration unit containing natural or engineered microorganisms like bacteria and fungi. These microorganisms metabolize and break down odor-causing compounds into harmless byproducts through a biological process. Air is passed through the biofilter, where the microorganisms thrive, effectively neutralizing and deodorizing the air. This technology is commonly used in wastewater treatment plants, industrial facilities, composting sites, and indoor spaces to maintain air quality and mitigate unpleasant odors.

The industry trend for Air Deodorization Biofilters is driven by the increasing focus on environmental sustainability and air quality improvement. As regulations become stricter regarding air emissions and odor control, there is growing demand for efficient and eco-friendly odor removal solutions. The trend includes innovations in biofilter design and optimization for better odor removal efficiency, reduced energy consumption, and extended lifespan. Additionally, biofilters are being integrated into various applications, including residential and commercial HVAC systems, to enhance indoor air quality. The industry is aligning with the broader goals of reducing air pollution and creating healthier living and working environments.
