**The report requires updating with new data and is sent in 48 hours after order is placed.**

The global Air Dynamic Sieving Instrument market size is predicted to grow from US$ 128 million in 2025 to US$ 162 million in 2031; it is expected to grow at a CAGR of 4.0% from 2025 to 2031.

The air dynamic sieving instrument uses negative pressure suction or positive pressure blowing to make the air flow pass through the screen and impact the powder particles. Under negative pressure, the agglomerated particles are deagglomerated and sieved through the screen. Fine particles enter the cyclone separator through the screen, while coarse particles remain on the screen, thus achieving the separation of coarse and fine particles. The air dynamic sieving instrument is mainly used for particle size detection of laboratory powder samples. It can effectively prevent the occurrence of particle agglomeration and improve the accuracy and efficiency of sieving. In addition, the equipment is also suitable for particle size analysis in scientific research, teaching, and pharmaceutical, food, chemical and other industries.

United States market for Air Dynamic Sieving Instrument is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
