The global Air Headers market size is predicted to grow from US\$ 952 million in 2025 to US\$ 1250 million in 2032; it is expected to grow at a CAGR of 4.0% from 2026 to 2032.

An Air Header typically refers to a distribution manifold assembly used in public works projects for air supply. It centralizes a single compressed air inlet into multiple outlets for use by various points of air consumption. Each outlet often has its own isolation valve (commonly a ball valve) for single-point maintenance and isolation. It is used to deliver instrument air from the compressor to various pneumatic instruments and actuators, such as valve positioners, pressure controllers, flow meters, and other pneumatic accessories. It is a standardized component in the instrument air system of an installation for 'local distribution.'

From the perspective of the upstream and downstream industry chain, the upstream mainly consists of raw materials and standard components: stainless steel (commonly 316/316L) pipes or bars serve as the main blanks, with welded or threaded connections at the ends and branches, along with standard components such as valves, fittings, and threaded/flange ports. The downstream primarily consists of EPC general contractors, instrumentation contractors, and end-user owners, with applications concentrated in process industries such as refining/oil and gas, chemicals, and energy.

Global sales are projected to reach 12.8 million units in 2025, with an average market price of \$65-90 per unit. The industry's gross profit margin is around 35%.

Because leaks in compressed air systems can lead to significant energy waste, and standardized welded distribution manifolds are touted by some manufacturers as reducing potential leak paths and installation time, competition in this product category often focuses on materials/welding and non-destructive testing, cleanliness and reliability, delivery time, and project-based configuration capabilities. Manufacturers

explicitly position air heads as 'distributing air from the compressor to pneumatic instrument actuators (such as flow meters, pressure controllers, valve positioners, etc.).' Market demand for these manifolds is strongly correlated with plant investments, production line expansions, and automation upgrades in the process industry.
