The global Air Hydraulic Booster market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The working principle of the Air Hydraulic Booster is similar to that of the pressure supercharger, which exerts a very low pressure on the large-diameter air-driven piston. When the pressure acts on a small area of the piston, a high pressure is generated. Through a two five ventilation control reversing valve, the booster pump can achieve continuous operation. The high pressure plunger controlled by the check valve constantly discharge the liquid, and the outlet pressure of the booster pump is related to the air driving pressure. When the pressure balance between the driving part and the output liquid part is reached, the supercharger will stop running and no longer consume air. When the output pressure drops or the air drive pressure increases, the booster pump will automatically start running, until the pressure balance is reached again after the automatic stop using a single gas control non-balanced gas distribution valve to realize the automatic reciprocating movement of the pump, the pump body gas drive part is made of aluminum alloy.

United States market for Air Hydraulic Booster is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
