The intake manifold is typically made of cast aluminum or plastic and is attached to the top of the engine's cylinder head. It consists of several individual passages or runners that connect to each cylinder of the engine. These passages are designed to evenly distribute the air-fuel mixture to each cylinder. In a typical gasoline engine, the intake manifold receives air from the throttle body, which controls the amount of air entering the engine. The throttle body is connected to the intake manifold and regulates the engine's air intake based on driver inputs or engine control unit (ECU) commands. The design of the intake manifold is critical for optimal engine performance. Engineers consider factors like runner length, diameter, and shape to achieve the desired airflow characteristics for specific operating conditions. Intake manifold designs can vary depending on the engine configuration, such as inline, V-type, or rotary engines.
