The air-jet loom uses the compressed air jetted out to produce frictional traction on the weft yarn, bringing the weft yarn through the shed, and achieves the purpose of weft insertion through the jet generated by the air jet. This weft insertion method enables the loom to achieve high speed and high productivity. Therefore, among several shuttleless looms, the air-jet loom has the highest speed. In addition, air-jet looms also have the advantages of wide variety adaptability, low machine material consumption, high efficiency, and low noise, and have become one of the most promising new fabric machines.

Water-jet looms use water jets to make the yarn softer and improve fabric quality. It can pass the yarn through the nozzle holes and use the jet water to make the yarn softer during the weaving process, thereby achieving the production of high-quality fabrics. Water-jet looms are widely used in textile, clothing and other industries. The fabrics produced are soft, comfortable and breathable. Water-jet weft insertion has greater friction and traction on weft yarns than air-jet weft insertion, and its diffusivity is smaller, so it is suitable for weft insertion of filaments such as synthetic fibers and glass fibers with smooth surfaces.
