The global Air Operated Conveyor market size is predicted to grow from US\$ 1252 million in 2025 to US\$ 1676 million in 2031; it is expected to grow at a CAGR of 5.0% from 2025 to 2031.

An air operated conveyor is a type of conveyor system that uses compressed air to move materials from one location to another. It consists of a series of tubes or pipes that are connected to a blower or compressor. When the air is released into the tubes, it creates a vacuum or pressure that propels the materials through the system.

Air operated conveyors are commonly used in industries such as manufacturing, packaging, and food processing. They are often used to transport lightweight and granular materials, such as powders, grains, or small parts. The materials are typically loaded into a hopper or container at one end of the conveyor, and the air pressure or vacuum created by the system moves them along the tubes to the desired destination.

One of the advantages of air operated conveyors is their flexibility and adaptability. The system can be easily modified or expanded to accommodate different materials or production requirements. They are also relatively low maintenance compared to other types of conveyors, as they do not require motors or belts.

However, air operated conveyors may have limitations in terms of the distance and speed at which materials can be transported. The efficiency of the system can also be affected by factors such as air pressure, tube diameter, and the type of material being conveyed. Therefore, it is important to carefully consider the specific requirements of

the application before implementing an air operated conveyor system.
