In 2025, the global production capacity of Air Pollution Monitoring Station was approximately 64,000 units.

Air Pollution Monitoring Station is an environmental monitoring system designed to continuously measure and analyze atmospheric pollutants and air quality parameters. The system integrates gas sensors, particulate matter detectors, sampling modules, communication units, data processing equipment, and monitoring platforms to provide real-time information on pollutants such as PM2.5, PM10, NOx, SO2, CO, and ozone. It is widely used in urban environmental monitoring, industrial emission management, smart city systems, and public health applications. The product boundary includes fixed and integrated air quality monitoring stations, excluding individual sensors and software-only monitoring platforms.

The air pollution monitoring station industry chain includes upstream suppliers of sensors, optical components, electronic modules, communication devices, power systems, and structural materials; the midstream sector covers station design, equipment integration, calibration, installation, and maintenance; the downstream sector

includes government environmental agencies, industrial enterprises, urban management systems, research institutions, and public monitoring networks. Market growth is driven by stricter environmental regulations, smart city development, and increasing demand for real-time air quality data.

United States market for Air Pollution Monitoring Station is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Air Pollution Monitoring Station is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

Europe market for Air Pollution Monitoring Station is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
