An air sensor is a device designed to detect and measure the concentration of various gaseous pollutants, such as carbon monoxide, nitrogen oxide, sulfur dioxide, ozone, and fine particulate matter (PM2.5) in the air. Air sensors can be used for a wide range of applications, including environmental monitoring, air quality management, industrial processes, transportation, and health and safety.

Air sensors typically work by detecting changes in the property of substances that are present in the air, such as changes in the levels of pollutants or in temperature or pressure. They convert these signals into measurable electrical or optical signals that

can be analyzed and interpreted using specialized software or equipment. Air sensors come in different types, including electrochemical, photoionization, semiconductor, and optical sensors.
